Online Appendix: Disclosure Regulation, Stock Liquidity, and International Policy Diffusion

1 Supporting Results

These comparisons retain the declared models, alternative family weights and restricted historical benchmarks. Each uses its stated sample. The main paper's sole appendix defines the variables; this separate document contains additional results and source detail.

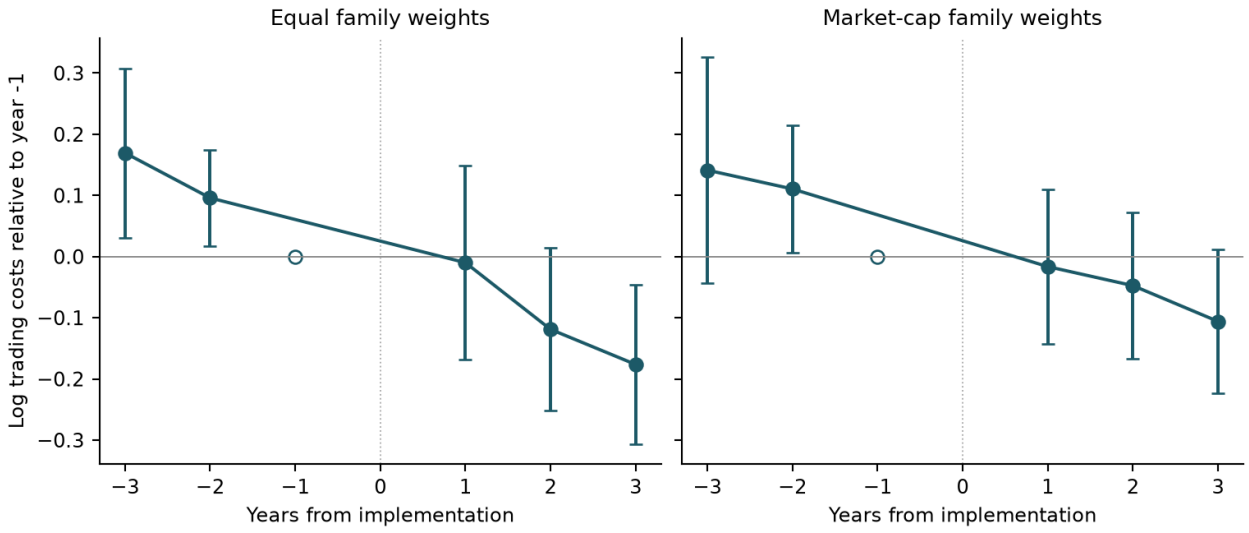

Figure OA1. Liquidity around implementation under both family weights
Year minus one is the reference; the implementation year is omitted. Intervals use country-cluster inference. The panels assess event-time differences without establishing parallel trends or separating concurrent reforms.

Table OA1. Liquidity estimates across regulatory families

Family	Estimate	Adopters	Comparisons
Expanded auditor reports	−0.005	20	7
	(0.144)		
Public bank country reports	−0.197	13	32
	(0.159)		
GHG emissions reporting	−0.353***	2	7
	(0.037)		
Environmental, social and governance reports	−0.148	22	25
	(0.180)		
Supply-chain disclosure	−0.181*	4	7
	(0.088)		

This table reports country-level rollout estimates. The outcome is log Bid-Ask Spread; lower values indicate lower trading costs and greater stock liquidity. Each cohort uses fixed companies in three pre-implementation years and years one to three after the documented milestone, excluding the implementation year. Country weights use GDP in the preceding year. Family weights are equal or proportional to the baseline sample market value of adopting-country companies. A stacked objective and an explicit average of family coefficients are distinct pooling targets. Standard errors in parentheses cluster by country and preserve dependence across policy stacks. *, ** and *** denote unadjusted significance at 10%,5% and 1%. These are country-policy comparisons, not verified effects on every legally covered issuer. Each row is a separate family estimate. Country counts can overlap. The climate-category liquidity estimate is supported by GHG emissions reporting in the UK (2013) and Vietnam (FY2021). Supply-chain adopters are Australia (2019), France (2017), the UK (2016) and the US observation based on California (2012); the last is partial national-market exposure, not a federal mandate. Concurrent reforms, including the UK 2013 auditor and greenhouse-gas requirements, cannot be separated at the country-year level.

Table OA2. Other channels of international implementation

Channel	Estimate	Countries	Events
Growth among earlier adopters	0.059	35	47
	(0.060)		
Larger geographic peer	0.242	19	30
	(0.161)		
Larger peer: recent implementation	0.198	19	30
	(0.173)		
Larger peer: older implementation	0.281	19	30
	(0.241)		
Language-peer implementation	0.087	26	48
	(0.055)		
Trade-competitor implementation	0.114	16	19
	(0.087)		
External financial dependence	−0.015	20	22
	(0.015)		

This table reports separate channel models with lagged income, GDP growth and trade. These estimates use equal family mass. Both weights are reported in Online Appendix Table OA13. Continuous variables are standardized; binary indicators retain their original scale. Standard errors cluster by country. Growth learning compares prior-year growth among earlier and later adopters within a fixed geographic network restricted to documented histories. The larger peer is fixed using GDP in 2000. Competitors are selected by export-pattern similarity in 2000. External finance is IMF credit plus aid relative to GDP. A dash denotes an unestimated model, including insufficient sample support, not an estimated zero. Separate models can use different samples. These proxies measure associations with proposed channels and do not establish policymakers' motives.

Table OA3. Liquidity estimates with country conditions

	(1)	(2)	(3)	(4)
Family weights	Equal	Market cap	Equal	Market cap
Aggregation	Stacked	Stacked	Average	Average
Trading costs	−0.133**	−0.092	−0.118*	−0.076
	(0.063)	(0.078)	(0.069)	(0.083)
Price impact	−0.103	−0.054	−0.070	−0.026
	(0.074)	(0.092)	(0.075)	(0.080)
Zero-return days	0.001	0.005	0.004	0.008
	(0.006)	(0.007)	(0.005)	(0.006)
Illiquidity index	−0.048	−0.018	−0.030	−0.003
	(0.035)	(0.042)	(0.028)	(0.034)
Countries	46	46	46	46
Families	5	5	5	5
Country conditions	X	X	X	X

This table reports country-level rollout estimates. Outcomes are log trading costs, log price impact, zero-return days and the standardized illiquidity index; higher values indicate less liquidity. Each cohort uses fixed companies in three pre-implementation years and years one to three after the documented milestone, excluding the implementation year. Country weights use GDP in the preceding year. Family weights are equal or proportional to the baseline sample market value of adopting-country companies. A stacked objective and an explicit average of family coefficients are distinct pooling targets. Standard errors in parentheses cluster by country and preserve dependence across policy stacks. *, ** and *** denote unadjusted significance at 10%,5% and 1%. These are country-policy comparisons, not verified effects on every legally covered issuer. This comparison uses 3 years on each side. Country conditions, where included, are lagged log GDP per capita, GDP growth and trade/GDP. Different horizons or control availability can change sample membership. Price impact is log Amihud; zero-return days are a fraction. The index averages three standardized illiquidity measures. Negative coefficients indicate greater liquidity.

Table OA4. Two-year comparison windows

	(1)	(2)	(3)	(4)
Family weights	Equal	Market cap	Equal	Market cap
Aggregation	Stacked	Stacked	Average	Average
Trading costs	−0.046	0.012	−0.032	0.005
	(0.078)	(0.111)	(0.083)	(0.092)
Price impact	0.018	0.121	0.057	0.132
	(0.124)	(0.163)	(0.141)	(0.119)

Countries	49	49	49	49
Families	6	6	6	6
Country conditions				

This table reports country-level rollout estimates. Outcomes are log trading costs, log price impact, zero-return days and the standardized illiquidity index; higher values indicate less liquidity. Each cohort uses fixed companies in two pre-implementation years and years one to two after the documented milestone, excluding the implementation year. Country weights use GDP in the preceding year. Family weights are equal or proportional to the baseline sample market value of adopting-country companies. A stacked objective and an explicit average of family coefficients are distinct pooling targets. Standard errors in parentheses cluster by country and preserve dependence across policy stacks. *, ** and *** denote unadjusted significance at 10%,5% and 1%. These are country-policy comparisons, not verified effects on every legally covered issuer. This comparison uses 2 years on each side. Country conditions, where included, are lagged log GDP per capita, GDP growth and trade/GDP. Different horizons or control availability can change sample membership. Price impact is log Amihud; zero-return days are a fraction. The index averages three standardized illiquidity measures. Negative coefficients indicate greater liquidity.

Countries	47	47	47	47
Families	5	5	5	5
Country conditions				

This table reports country-level rollout estimates. Outcomes are log trading costs, log price impact, zero-return days and the standardized illiquidity index; higher values indicate less liquidity. Each cohort uses fixed companies in three pre-implementation years and years one to three after the documented milestone, excluding the implementation year. Country weights use GDP in the preceding year. Family weights are equal or proportional to the baseline sample market value of adopting-country companies. A stacked objective and an explicit average of family coefficients are distinct pooling targets. Standard errors in parentheses cluster by country and preserve dependence across policy stacks. *, ** and *** denote unadjusted significance at 10%,5% and 1%. These are country-policy comparisons, not verified effects on every legally covered issuer. This comparison uses 3 years on each side. Country conditions, where included, are lagged log GDP per capita, GDP growth and trade/GDP. Different horizons or control availability can change sample membership. Price impact is log Amihud; zero-return days are a fraction. The index averages three standardized illiquidity measures. Negative coefficients indicate greater liquidity.

Table OA7. Confidential tax reporting and liquidity

	3-year	3-year + X	2-year	2-year + X
Trading costs	0.142	0.100	0.062	0.089
	(0.169)	(0.146)	(0.121)	(0.139)
Price impact	0.064	−0.085	−0.016	0.016
	(0.166)	(0.218)	(0.156)	(0.170)
Zero-return days	−0.013	−0.016	0.013	0.015
	(0.017)	(0.018)	(0.018)	(0.019)
Illiquidity index	0.012	−0.029	0.054	0.069
	(0.113)	(0.114)	(0.091)	(0.104)

This table reports confidential country-by-country tax reporting separately from disclosures available to investors. The same country-cohort construction and GDP weights apply; X adds the country conditions defined in Table OA3. Tax-authority reporting is not classified as public banking country reporting or public multinational country reporting. A requirement to transmit a return does not establish public access. Country-cluster standard errors appear in parentheses.

Table OA8. Learning comparison including coordinated implementations

	(1)	(2)	(3)	(4)
Estimator	Logit	Logit	Within	Within
Family weights	Equal	Market cap	Equal	Market cap
Foreign-policy exposure	−0.477	−0.516	0.016	0.017
	(0.497)	(0.382)	(0.035)	(0.038)
Successful foreign adopters	−0.461	−0.765	−0.000	−0.001
	(0.470)	(0.495)	(0.013)	(0.031)
Exposure x successful adopters	−0.109	0.128	−0.005	−0.004
	(0.178)	(0.150)	(0.013)	(0.015)
Country–family–years	972	972	1955	1955
Countries	48	48	48	48
Implementations	136	136	137	137
Families	7	7	8	8

This table reports associations with documented implementation timing. Foreign-policy exposure is the lagged portfolio-weighted share of countries with the requirement. Successful foreign adopters are the share of observed earlier adopters with falling same-company log trading costs, measured before the focal implementation year; these are observed outcomes, not estimated effects caused by the foreign rule. Both primitives and their product enter together with lagged income, GDP growth and trade. Continuous primitives are standardized before the interaction. Logit includes family and year effects; Within denotes a linear probability model with country–family and family–year effects. Logit coefficients are log odds; within coefficients are probability changes. Country-cluster standard errors appear in parentheses. The samples differ because logit removes fixed-effect groups without outcome variation. Nominal stars use the conventions in Table 2; the full 160-model,256-focal-test adjustment is retained in the results files. Decision dates are not available for all cases, so these models do not establish learning at the political decision date.

Table OA9. Channel associations including coordinated implementations

Channel	Equal	Market cap	Countries	Events
Growth among earlier adopters	−0.586	−0.388	59	167
	(0.596)	(0.510)		
Larger geographic peer	−0.236	−0.589	39	123
	(0.582)	(0.755)		
Larger peer: recent implementation	0.794	0.382	39	123
	(0.836)	(1.240)		
Larger peer: older implementation	−0.804	−1.394**	39	123
	(0.612)	(0.546)		
Language-peer implementation	–	–	34	80
Trade-competitor implementation	−1.035***	−1.342***	40	107
	(0.202)	(0.163)		
External financial dependence	–	–	21	22

This table reports separate channel models with lagged income, GDP growth and trade. Weights give equal family mass or baseline market-cap family mass. Continuous variables are standardized; binary indicators retain their original scale. Standard errors cluster by country. Growth learning compares prior-year growth among earlier and later adopters within a fixed geographic network restricted to documented histories. The larger peer is fixed using GDP in 2000. Competitors are selected by export-pattern similarity in 2000. External finance is IMF credit plus aid relative to GDP. A dash denotes an unestimated model, including insufficient sample support, not an estimated zero. Separate models can use different samples. These proxies measure associations with proposed channels and do not establish policymakers' motives.

Table OA10. Restricted liquidity benchmarks

Pooling target	Estimate	p-value
Stacked: equal family mass	-0.223	< 0.001
	(0.048)	
Stacked: market-cap family mass	-0.206	< 0.001
	(0.058)	
Explicit equal-family average	-0.199	0.001
	(0.058)	
Explicit market-cap family average	-0.199	0.004
	(0.066)	
GLS common effect	-0.238	< 0.001
	(0.025)	

This table reports five pooling estimates for a restricted set of 30 country–family implementations,46 countries and 1,002 country–stack–years. Its auditor and climate contrasts both identify the UK 2013 cohort and the same 433 treated company records. The directly stacked and explicit-average coefficients are different targets. GLS uses estimated covariance weights, not market-cap weights, and concentrates on the concurrent UK contrasts.

Table OA11. Family objective masses and coefficient contributions

Family	Equal mass	Cap mass	Equal effect	Cap effect
Expanded auditor reports	20.0%	29.2%	18.7%	28.7%
Public bank country reports	20.0%	17.9%	19.0%	17.8%
Climate disclosure	20.0%	5.4%	25.1%	7.2%
Environmental, social and governance reports	20.0%	23.9%	12.4%	15.5%
Supply-chain disclosure	20.0%	23.6%	24.8%	30.8%

This table reports the family objective masses and effective coefficient weights for the primary uncontrolled stacked model. Equal mass gives each family 20%. Cap mass uses the baseline sample market value represented by adopting-country companies. Effective weights also reflect residual treatment variation and sum to 100% within each model. They are not GLS covariance weights or the share of all global issuer market value. The explicit family-average estimators use the objective masses directly.

Table OA12. Learning under alternative family weights

	(1)	(2)	(3)	(4)
Estimator	Logit	Logit	Within	Within
Family weights	Equal	Market cap	Equal	Market cap
Foreign-policy exposure	0.372	0.021	0.084	0.079
	(0.554)	(0.446)	(0.050)	(0.047)
Successful foreign adopters	-1.851^{**}	-1.561^{**}	0.002	0.002
	(0.740)	(0.739)	(0.044)	(0.102)
Exposure x successful adopters	0.832^{**}	0.907^{***}	-0.022	-0.013
	(0.310)	(0.258)	(0.023)	(0.023)
Country–family–years	202	202	432	432
Countries	24	24	24	24
Implementations	25	25	26	26
Families	5	5	6	6

This table reports associations with documented implementation timing. Foreign-policy exposure is the lagged portfolio-weighted share of countries with the requirement. Successful foreign adopters are the share of observed earlier adopters with falling same-company log trading costs, measured before the focal implementation year; these are observed outcomes, not estimated effects caused by the foreign rule. Both primitives and their product enter together with lagged income, GDP growth and trade. Continuous primitives are standardized before the interaction. Logit includes family and year effects; Within denotes a linear probability model with country–family and family–year effects. Logit coefficients are log odds; within coefficients are probability changes. Country-cluster standard errors appear in parentheses. The samples differ because logit removes fixed-effect groups without outcome variation. Nominal stars use the conventions in Table 2; the full 160-model,256-focal-test adjustment is retained in the results files. Decision dates are not available for all cases, so these models do not establish learning at the political decision date.

Table OA13. Other channels under alternative family weights

Channel	Equal	Market cap	Countries	Events
Growth among earlier adopters	0.059	0.075	35	47
	(0.060)	(0.081)		
Larger geographic peer	0.242	0.298	19	30
	(0.161)	(0.209)		
Larger peer: recent implementation	0.198	0.385	19	30
	(0.173)	(0.228)		
Larger peer: older implementation	0.281	0.202	19	30
	(0.241)	(0.202)		
Language-peer implementation	0.087	0.073	26	48
	(0.055)	(0.053)		
Trade-competitor implementation	0.114	0.112	16	19
	(0.087)	(0.091)		
External financial dependence	−0.015	−0.044*	20	22
	(0.015)	(0.025)		

This table reports separate channel models with lagged income, GDP growth and trade. Weights give equal family mass or baseline market-cap family mass. Continuous variables are standardized; binary indicators retain their original scale. Standard errors cluster by country. Growth learning compares prior-year growth among earlier and later adopters within a fixed geographic network restricted to documented histories. The larger peer is fixed using GDP in 2000. Competitors are selected by export-pattern similarity in 2000. External finance is IMF credit plus aid relative to GDP. A dash denotes an unestimated model, including insufficient sample support, not an estimated zero. Separate models can use different samples. These proxies measure associations with proposed channels and do not establish policymakers' motives.

2 Published Evidence and Country Coverage

The register already contains dated source records, but it is not an exhaustive global legal census. A published article can supply a historical adoption table or a single-rule setting without supplying every later country. The crosswalk covers ten public families and the separate confidential-tax comparison. For newer ISSB requirements, no verified top-journal study supplies a complete 2025 list; dated official profiles and national rules are required. Published benchmark cases have not been silently promoted to legally verified treatment dates.

Table OA14. Disclosure Families and Published Evidence

Family	Published evidence	Country scope and limits
Expanded auditor reports	(Lennox et al. 2023) Review of Accounting Studies	UK expanded reports; not a worldwide KAM/CAM adoption list.
Public bank country reports	(Joshi et al. 2020) Contemporary Accounting Research	EU bank public CbCR; covered banks and staged content differ from all listed firms.
Public multinational country reports	(Müller et al. 2024) Contemporary Accounting Research	European public tax-reporting legislation; not every subsequent country implementation.
Climate-related disclosure	(Downar et al. 2021) Review of Accounting Studies	UK GHG mandate with European comparison firms; not a global emissions-and-risk reporting census.
Environmental, social and governance reports	(Krueger et al. 2024) Journal of Accounting Research	Published Table 1: 38 treated countries and 27 controls. Mandatory ESG requires all three topics. Our broader episode register has different content and clock definitions.
Payments to governments	(Rauter 2020) Journal of Accounting Research	Table 1: 32 jurisdictions in Europe and Canada; entry into force and covered financial periods are distinct. Wider than our current calendar.
IFRS financial statements	(Daske et al. 2008) Journal of Accounting Research	Table 1 Panel A: 26 historical adoption countries; not all subsequent mandatory-IFRS jurisdictions.
Supply-chain disclosure	(She 2022, Baik et al. 2024) The Accounting Review; Journal of Accounting Research	California transparency and US conflict-mineral reporting are different mandates; neither paper is an exhaustive global due-diligence list.
Sustainability financial reporting	(Christensen et al. 2021, IFRS Foundation 2025) Review of Accounting Studies; IFRS Foundation	The review predates ISSB implementation. No verified top-journal paper supplies a complete 2025 list; use dated official profiles and national rules.
Electronic financial reporting	(Blankespoor et al. 2014) Review of Accounting Studies	US SEC XBRL mandate; not a worldwide electronic-reporting adoption list.
Confidential tax reports	(De Simone and Olbert 2022, Nessa et al. 2025) The Accounting Review; Journal of Accounting Research	Tax-authority CbCR settings, including OECD and US implementation; not disclosures available to investors.

The next table enumerates all 211 public country–family milestones in the current 90-jurisdiction calendar during 2000–2025. It is exhaustive for that frozen calendar, not for all countries' reporting laws. Full date bases and source links accompany the downloadable calendar. The US supply-chain entry concerns California rather than a federal mandate. Climate content within broader sustainability rules does not establish a separately dated climate event.

Table OA15. All Dated Public Milestones in the Current Calendar

Family	Country and source-defined implementation year
Expanded auditor reports	Australia (2016); Austria (2016); Belgium (2016); Bulgaria (2016); Brazil (2016); Canada (2020); China (2017); Cyprus (2016); Czechia (2016); Germany (2016); Denmark (2016); Spain (2016); Estonia (2016); Finland (2016); France (2016); United Kingdom (2013); Greece (2016); Hong Kong (2016); Croatia (2016); Hungary (2016); India (2018); Ireland (2016); Israel (2022); Italy (2016); Japan (2021); Korea, Republic of (2016); Lithuania (2016); Luxembourg (2016); Latvia (2016); Malta (2016); Netherlands (2014); New Zealand (2016); Poland (2016); Portugal (2016); Romania (2016); Saudi Arabia (2017); Singapore (2016); Slovakia (2016); Slovenia (2016); Sweden (2016); United States (2019); South Africa (2016)
Public bank country reports	Austria (2014); Belgium (2014); Bulgaria (2014); Cyprus (2014); Czechia (2014); Germany (2014); Denmark (2014); Spain (2014); Estonia (2014); Finland (2014); France (2014); United Kingdom (2014); Greece (2014); Croatia (2014); Hungary (2014); Ireland (2014); Italy (2014); Lithuania (2014); Luxembourg (2014); Latvia (2014); Malta (2014); Netherlands (2014); Poland (2014); Portugal (2014); Romania (2014); Slovakia (2014); Slovenia (2014); Sweden (2014)
Public multinational country reports	Australia (2024); Austria (2024); Belgium (2024); Bulgaria (2025); Cyprus (2024); Czechia (2024); Germany (2024); Denmark (2024); Spain (2024); Estonia (2024); Finland (2024); France (2024); Greece (2024); Croatia (2024); Hungary (2024); Ireland (2024); Italy (2024); Lithuania (2024); Luxembourg (2024); Latvia (2024); Malta (2024); Netherlands (2024); Poland (2024); Portugal (2024); Romania (2023); Slovakia (2024); Slovenia (2024); Sweden (2024)
Climate-related disclosure	Australia (2025); United Kingdom (2013); Hong Kong (2025); Malaysia (2025); New Zealand (2023); Singapore (2025); Viet Nam (2021)
Environmental, social and governance reports	Australia (2014); Austria (2017); Belgium (2017); Bulgaria (2017); Chile (2015); Cyprus (2017); Germany (2017); Denmark (2016); Egypt (2022); Spain (2017); Estonia (2017); Finland (2017); France (2002); United Kingdom (2007); Greece (2016); Hong Kong (2016); Hungary (2017); Indonesia (2012); India (2012); Ireland (2017); Italy (2017); Jordan (2022); Kuwait (2025); Morocco (2020); Malta (2017); Malaysia (2016); Netherlands (2017); Norway (2013); Oman (2024); Peru (2016); Philippines (2019); Poland (2017); Portugal (2017); Romania (2017); Singapore (2017); Slovenia (2017); Sweden (2017); Thailand (2021); Türkiye (2020); Taiwan, Province of China (2014); Viet Nam (2016); South Africa (2010)
Payments to governments	Canada (2015); Switzerland (2022); Germany (2015); France (2015); United Kingdom (2015); Netherlands (2016); Norway (2014); Sweden (2016); United States (2023)

Sustainability financial reporting	Mexico (2025); Pakistan (2025); Türkiye (2024); Tanzania, United Republic of (2025); Zambia (2025)

All Dated Public Milestones in the Current Calendar (continued)

Family	Country and source-defined implementation year
Electronic financial reporting	United Kingdom (2011); Japan (2008); Singapore (2007); United States (2009)

The following published lists retain their own definitions and historical coverage. The Krueger ESG indicator requires all three topics; our register includes report episodes with varied content. Rauter's table includes more extractive jurisdictions than the current calendar. The differences are benchmarks for source reconciliation, not evidence that unlisted calendar countries lack these laws.

Table OA16. Published Country Lists as Historical Benchmarks

Publication and locator	Countries in the stated publication table
Krueger et al. (2024), Table 1 Panel A	Argentina (2008); Australia (2003); Austria (2016); Belgium (2009); Bulgaria (2016); Canada (2004); Chile (2015); China (2008); Cyprus (2016); Denmark (2016); Finland (2016); France (2001); Germany (2016); Greece (2006); Hong Kong (2015); Hungary (2016); India (2015); Indonesia (2012); Ireland (2016); Italy (2016); Malaysia (2007); Malta (2016); Netherlands (2016); Norway (2013); Pakistan (2009); Peru (2015); Philippines (2011); Poland (2016); Portugal (2010); Romania (2016); Singapore (2016); Slovenia (2017); South Africa (2010); Spain (2012); Sweden (2016); Taiwan (2019); Turkey (2014); United Kingdom (2013)
Rauter (2020), Table 1	Austria; Belgium; Bulgaria; Canada; Croatia; Cyprus; Czech Republic; Denmark; Estonia; Finland; France; Germany; Greece; Hungary; Iceland; Ireland; Italy; Latvia; Liechtenstein; Lithuania; Luxembourg; Malta; Netherlands; Norway; Poland; Portugal; Romania; Slovakia; Slovenia; Spain; Sweden; United Kingdom
Daske et al. (2008), Table 1 Panel A	Australia; Austria; Belgium; Czech Republic; Denmark; Finland; France; Germany; Greece; Hong Kong; Hungary; Ireland; Italy; Luxembourg; The Netherlands; Norway; Philippines; Poland; Portugal; Singapore; South Africa; Spain; Sweden; Switzerland; United Kingdom; Venezuela

3 Climate Content and Overlapping Requirements

EU environmental reporting under the NFRD and emissions reporting under ESRS E1-6 have scope, materiality and transition provisions (European Parliament and Council 2014, European Commission 2023). They are not interchangeable with an unconditional GHG inventory mandate. A reporting episode should not receive multiple counts merely because it covers several topics. The two supported climate-category liquidity episodes are the UK 2013 and Vietnam FY2021 cases; the result must not be generalized to all EU or global climate reporting. Existing ESG and sustainability entries remain in the calendar. The estimates use the recorded implementation calendar and do not establish an exhaustive global climate-disclosure effect.

4 Source Dates and Coverage

The review prioritises 2000–2025 and 90 market-data jurisdictions. Full national histories are not required for a supported point fact. The source archive preserves the difference between an original rule, an amendment, a current compilation and an authority's implementation account. An unknown date, eligible population or public filing remains unknown.

Table OA17 lists 15 reconciled implementation milestones. It retains covered-period, engagement and filing clocks separately. In particular, a statutory deadline is not an observed filing receipt. The country-level estimates do not use a fabricated issuer filing date or assume every company satisfies the legal scope.

Confidential tax country reports are separate from public bank and public multinational reports. Within environmental and social reporting, mandatory reports can coexist with materiality,

optional metrics and disclosure-or-explanation provisions. The country-family label does not certify unconditional reporting of all E, S and G metrics.

Table OA17. Reconciled Implementation Milestones

Country	Clock	Date	Coverage and interpretation
Canada	Period end	2020-12-15	TSX mandatory KAM; NI 81-106 investment funds excluded. 2018 general standard/voluntary framework is not the 2020 mandate. Source
China	Application	2017-01-01	Initial A+H/H-share CAS-audit phase; broader listed/deemed-listed phase follows 2018. This is partial country exposure. Source
Brazil	Period end	2016-12-31	Listed-entity KAM; other entities only where law requires or auditor elects. Source
Israel	Period end	2022-12-31	Initial mandatory internal-control-audit/attached-statement perimeter; voluntary banking 2021 and later 2023 expansion are distinct. Source
Saudi Arabia	Engagement start	2017-01-01	Engagements entered into from 1 January 2017. This is not a financial-period start or observed report filing. Source
Netherlands	Period end	2014-12-15	Earlier national expanded-reporting milestone replaces 2016 EU milestone for this broad expanded-auditor-reporting series;2013 pilots are voluntary. Source
Colombia	Annual period end	2015-12-31	Group 1: securities issuers, public-interest entities and other entities meeting the stated size/international-connection tests. 2014 opening balances are transition, not first annual statements. Source
Ecuador	Application	2010-01-01	Initial securities-law entities/external-audit-company phase under the 2008 schedule;2009 transition and superseded 2006 plan are not mandatory 2010 reporting. Source
Jordan	Information year	2022	ASE 20 companies report 2022 information fromJanuary 2023. Mandatory GRI report is separate from recommended SDG Impact Standards. Source

Country	Clock	Date	Coverage and interpretation
Morocco	Filing deadline	2020-04-30	First authority-reported implementation deadline 30 April 2020; content can require explanation for unavailable items. This is a statutory deadline, not an observed issuer filing. Source
Oman	Information year	2024	MSX listed SOAG reporting for 2024 activities, published 2025. Report-level obligation does not make every metric mandatory; materiality and item-specific optionality retained. GHG component is not counted as a second reform. Source
Kuwait	Information year	2025	Premier Market only; first report covers 2025 and publication is due 2026. No post-implementation liquidity effect can be estimated for this rollout from data ending 2025. Source
Vietnam	Legal force	2016-01-01	Public-company annual-report E/S content. Calendar uses legal force 1 January 2016; first annual-report financial-year transition is not imputed. Source
Vietnam	Report financial year	2021	AnnexIV GHG additions apply after FY 2020 grandfathering; FY 2021 report is distinct from the 2016 E/S rule. Annual report deadline 110 days, not 120. Source
South Korea	Period start	2016-01-01	Production-to-order sector key-audit-item disclosures precede the 2018 largest-listed and 2020 broad listed KAM phases. Country exposure is partial and is not described as universal ISA 701 coverage. Source

4.1 Climate and supply-chain sample coverage

The broad climate calendar includes emissions reporting and climate-risk reporting. Its primary liquidity estimate is supported by GHG emissions reporting in the UK (2013) and Vietnam (FY2021). The UK requirement concerns covered quoted companies' directors' reports. Vietnam's revised annual-report form adds total direct and indirect greenhouse-gas emissions and reduction initiatives; the FY2020 report remains under the predecessor circular. This is not a pooled estimate

of every modern climate-risk reporting framework.

Supply-chain adopters in the primary test are Australia (2019), France (2017), the UK (2016) and the US observation based on California (2012). California's law applies to specified retailers and manufacturers doing business in the state and exceeding the statutory receipts threshold; the US market observation is not universal federal treatment. Later rules can lack the post-implementation horizon or eligible comparison countries. The accompanying country-support file identifies included and excluded calendar cases without selecting by outcome.

5 Model Coverage and Reproduction

The liquidity matrix contains 64 pooled comparisons: two windows, two country-condition specifications, two family weights, two aggregation methods and four outcomes. It preserves every declared cell. The primary three-year design and the shorter two-year comparison have different supported samples.

The diffusion matrix contains 160 fits for ten proposed channels or channel combinations, two audiences, independent versus all documented implementations, two estimators and both family weights. Insufficient-support and unstable-logit cases remain in the registry rather than becoming estimated zeros. Holm adjustment covers all 256 attempted focal tests. The full matrix retains all declared comparisons and unsuccessful fits.

Numerical checks compare the liquidity transformation with full weighted dummy-variable regressions, reconstruct family averages and country-cluster inference, verify risk-set dates and lagged signals, and check paired-weight samples. These checks do not establish parallel trends, complete issuer coverage or causality. The complete aggregate coefficient files and legal-source crosswalk accompany the paper. Licensed firm observations are retained locally.
