Disclosure Regulation, Stock Liquidity, and International Policy Diffusion

Extended Appendix

26 October 2026

This appendix preserves the wider regulatory analysis and specification audit. Its universe differs from the public-disclosure focus of the main paper, so its averages answer a different question. The underlying results are retained with their original signs, sample restrictions and multiple-test adjustments. These are archived estimates, not additional tests chosen for a favourable result. The hypothesis-family adjustment follows Holm (1979).

The main paper and Online Appendix examine adoption using the framework of Koning et al. (2018). Complete diffusion matrices, failed fits, family weights, reviewed policy histories and numerical checks are preserved in the data folder and research archive. Unknown histories remain missing rather than permanent nonadoption.

Table E1: Broader regulatory universe: pooled liquidity

Outcome	**Families**	**Equal family Coefficient (SE)**	**Market-cap family Coefficient (SE)**
Year 1	13	+0.0068	+0.0184
Log spread		(0.0233)	(0.0349)
Year 1	13	+0.0268	-0.0251
Log price impact		(0.0381)	(0.0837)
Year 1	13	-0.0021	+0.0037
Zero-return share		(0.0021)	(0.0051)
Years 1–3	10	-0.0220	+0.0721
Log spread		(0.0353)	(0.0928)
Years 1–3	10	+0.0819	+0.1275
Log price impact		(0.0442)	(0.1136)
Years 1–3	10	-0.0035	-0.0003
Zero-return share		(0.0031)	(0.0073)

GDP country weights and the reviewed phase calendar. This pool includes regulatory categories outside the ten-family public-disclosure definition. Unsupported families receive no zero effect. Country uncertainty is conditional on recorded histories and sample membership. All signs are retained.

Table E2: All supported families in the broader following-year universe

Family	**Adopting countries**	**Log spread Coefficient (SE)**	**Log price impact Coefficient (SE)**	**Zero-return share Coefficient (SE)**
Audit Oversight	4	-0.0578 (0.0575)	-0.3803 (0.1362)	-0.0007 (0.0101)
Audit Reporting	20	-0.0624 (0.0568)	+0.0585 (0.0830)	-0.0131 (0.0066)
Beneficial Ownership	11	+0.0403 (0.0529)	+0.1809 (0.1025)	+0.0128 (0.0101)

Esg Mandatory Reviewed	22	-0.0647 (0.0293)	+0.0331 (0.0944)	+0.0305 (0.0118)
Extractive Payments	1	+0.1822 (0.0094)	+0.5297 (0.0053)	-0.0164 (0.0012)
Governance	5	+0.2187 (0.0552)	+0.2002 (0.1972)	+0.0282 (0.0058)
Ifrs	20	-0.0570 (0.1164)	+0.1201 (0.3486)	-0.0235 (0.0115)
Supply Chain	4	+0.0170 (0.0418)	-0.4576 (0.0620)	-0.0102 (0.0061)
Sustainability Financial	1	-0.1603 (0.1389)	-0.1743 (0.1496)	+0.0011 (0.0060)

The full set of supported family estimates underlying the broader pool. Each family uses its own documented countries and implementation cohorts. These estimates are not independent replications or a census of all regulations.

Table E3: Complete 1,296-specification audit

Outcome	**Attempts**	**Estimated**	**Negative**	**Positive**	**Grid Holm p < 0.05**
Log price impact	432	432	240	192	11
Log spread	432	432	276	156	11
Zero-return share	432	432	321	111	18

Every declared grid cell is retained. The matrix varies the clock, country and family weights, horizon, policy scope, coordinated decisions and controls. Choices were retrospective. Counts of correlated estimates are not independent confirmations; the complete CSV accompanies the project.

Collective disclosure: stacked DiD and pooling

Following Krueger et al. (2024), the country-level stacked design includes country-by-cohort and year-by-cohort effects. The sample holds companies fixed and uses documented later adopters as controls. The benchmark compares three pre-policy years with years 1–3 after adoption, omitting the implementation year. It covers five public families; two have only one adopting country. This is a calendar-year country adaptation, not a replication of fiscal-year firm regressions.

Table E4: Stacked and pooled spread estimates

Pooling	No controls	p	Controls	p
Stacked equal family mass	-0.223	$< .001$	-0.187	$< .001$
	(0.048)		(0.048)	
Stacked market-cap family mass	-0.206	$< .001$	-0.183	0.003
	(0.058)		(0.057)	
Average equal families	-0.199	0.001	-0.147	0.028
	(0.058)		(0.065)	
Average market-cap families	-0.199	0.004	-0.160	0.039
	(0.066)		(0.075)	
GLS common effect	-0.238	$< .001$	-0.157	$< .001$
	(0.025)		(0.042)	
Nonnegative minimum variance	-0.238	$< .001$	-0.157	$< .001$
	(0.025)		(0.042)	

GDP country weights; annual 1st/99th-percentile trimming. Reported p-values are unadjusted country-cluster diagnostics. Both direct stacked spread specifications without controls reject the pre-policy lead test. GLS without controls assigns 59.6% to climate disclosure, with one adopting country; its grid-adjusted p-value is below .001, conditional on estimated weights. It is not an equal-family or market-cap average.

The complete retrospective matrix retains all 5,184 combinations of trimming, timing, windows, country weights, controls, disclosure scope, outcomes and pooling. Family averages and GLS retain shared-country covariance. The nonnegative minimum-variance estimator restricts weights to sum to one and be nonnegative. Neither covariance weighting nor statistical significance resolves adoption endogeneity or pre-existing trends. The accompanying HTML and CSV report the full matrix, pre-policy tests and 576 additional adoption-support diagnostics.

Table E5: Spread estimates with broader adoption support

Pooling	No controls	p	Controls	p
Average: equal families	-0.217	0.167	-0.183	0.231
	(0.154)		(0.151)	
Average: market-cap families	-0.215	0.153	-0.176	0.223
	(0.148)		(0.143)	
GLS common effect	-0.208	0.135	-0.145	0.249
	(0.136)		(0.124)	
Nonnegative minimum variance	-0.208	0.135	-0.145	0.249
	(0.136)		(0.124)	

Same benchmark window, trimming and GDP country weights, requiring at least five adopting countries per family. Two families remain: bank public country reports and mandatory ESG. The restriction was specified after the focal grid revealed concentrated GLS weights. All 576 support diagnostics, including the minimum-two-adopter rule, are retained. No negative estimate both survives the diagnostic-wide Holm correction and has a pre-policy lead-test p-value at least .05. Nonrejection of a lead test is not proof of parallel trends.
